

London 2012 Olympic Park

The Challenge

EDF energy is providing power generation and distribution for the 2012 Olympics. Ensuring that these facilities are safe and secure and that the contract is completed to a strict deadline is critical. EDF required a qualified and competent partner who understands latest generation technology, networking and IT combined with the contracting experience to reliably deliver.

The Solution

The system uses internal and external intruder detection technologies using Honeywell systems products with remote monitoring and operation facilities to central control. The latest generation high performance Panasonic CCTV and Synectics digital recording is programmed to respond to alarm activations throughout the site and also interfaces to a multi-zoned intelligent fence-mounted acoustic detection system, once more providing remote viewing and operation over a dedicated network.

Access control on and off site is provided by corporate contactless cards. The reader locations and controls are again interfaced with the CCTV and alarm system management technologies. The access control is managed and monitored by EDF with all other technologies at a central location. Reflex is pleased to have worked with EDF on a number of projects, all of which demand delivery to the very highest of standards.
